

Abstract

09/484, 259

5 Homeotropically oriented layers and films of liquid
crystals especially on polymeric substrates. The layers and films, which
also can be multi-layered films comprising a homeotropically aligned
anisotropic film, are preparable by application of an orientation layer to the
substrate. The orientation layer can be either an organic surfactant which
10 is fixed in a matrix of a polymeric material or an inorganic thin layer such
as aluminum or Al_2O_3 .
